

Aboriginals and the Lost Ancient Colony Off NT's Coast

The geographical 'science' that aboriginal people were the first inhabitants of the continent of Australia is not a fact. It is touted as a fact through radio-graphical tests of ancient aboriginal sites, but radio-dating is very far from being accurate enough to produce absolute proof-of-age.¹

In fact, some Australoid peoples on the Australian mainland, bear a striking resemblance to some Sri Lankans. This indicates – on face – value that there have been waves of migration of peoples to Australia from different places across the globe. This migration is known by geographers, but it is not publicised in the media for the general public to understand.

Sri Lankan³

Interestingly, the Maori know that they are immigrants to NZ,⁴ even though they don't openly admit it.

Recently, scientists have discovered an ancient colony under the sea off the Northern Territory (NT) coast. This further confuses the issue of aboriginal claims to the land. Here's the abstract from the science journal:

“For most of the period of human occupation of Sahul (the combined Pleistocene landmass of Australia and New Guinea), lower sea levels exposed an extensive area of the northwest of the Australian continent, connecting the Kimberley and Arnhem Land into one vast area. Our analysis of high-resolution bathymetric data shows this now-drowned region existed as an extensive archipelago... transforming... into a fully exposed shelf containing an inland sea adjacent to a large freshwater lake. These were encircled by deep gorges and escarpments that likely acted as important resource zones and refugia for human populations at that time. Demographic modelling shows the shelf had a fluctuating potential carrying capacity... with the capability to support 50–500 k people at various times. Two periods of rapid global sea level rise at 14.5–14.1 ka⁵... and between 12 ka and 9 ka, resulted in the rapid drowning of ~50% of the Northwest Shelf. This likely caused a retreat of human populations, registering as peaks in occupational intensity at archaeological sites. We contend that the presence of an extensive archipelago on the Northwest Shelf... facilitated the successful dispersal of the first maritime explorers from Wallacea⁶, creating a familiar environment for their maritime economies to adapt to the vast terrestrial continent of Sahul.”⁷
