

Climate Crisis? What Climate Crisis?

The hysteria around Climate Change (the updated term for “Global Warming”) has changed to being screamed out as a “Climate Crisis”, with everything on Earth being prospectively destroyed by human endeavour. That’s everything, so that Earth becomes uninhabitable. Every negative eventuation¹ is being blamed on Climate Change, including fires, droughts, storms, etc. Even our food supply, it is said, will dwindle away and famines will become the norm. So much doom and gloom.

So, what’s going on in agriculture, our source of food supply? Surely agricultural production will mirror the ‘climate catastrophe’ that we are suffering under? But, **NO**.

As an example, here’s the the current soybean stats for the US:

“With a rebound in U.S. production, the world soybean crop will be a record 364 million tonnes in 2020/21, up 8% from this season, said the International Grains Council on Thursday. Record-setting corn and wheat crops were also forecast for 2020/21 and would contribute to the first increase of global stocks in four years...”

Those estimates of the U.S. crop are based on farmers' planting intentions in early March. Since then, soybean prices have strengthened. Traders expect a June survey of growers by the USDA will show an increase of 1.2 million acres in soybean plantings to 84.7 million acres, which could increase the soybean crop by 1.5 million tonnes. The USDA is scheduled to release the acreage report on Tuesday.”²

Hmmm...What Climate Crisis?
