

Climatologists Even Have Difficulty Predicting The Weather

“The science is in” because Climatologists’ climate models tell us that Catastrophic Climate Change (AKA Anthropogenic Climate Change) is a fact. These scientists have predicted with certainty that we are headed for an apocalypse unless we stop warming the planet with carbon dioxide.

The interesting thing about their ‘fool-proof’ climate models is that these same scientists have difficulty predicting the weather in a few days time. Not years in the future, as with climate models, but just a few days ahead.

The problem of predicting the future came to light again when Australia’s WeatherZone¹ had trouble deciding which model to use to predict the weather in Christmas Day in 2022. Yes, you got it right, there are numerous models for predicting climate and weather – bet you didn’t hear that confessed in the mainstream media and by politicians.

One news outlet published this in detail,² although they removed from the internet the video of the meteorologist confessing to the problem.

Their article shows graphics from WeatherZone highlighting the predictions of 3 models for both temperature³ and rainfall⁴ on Christmas Day. After looking at them, you’ll notice how widely varying each of the 3 predictions are in each graphic. (The footnotes for temperature and rainfall link directly to the graphics online)

The meteorologist is on record in the news article stating, “At longer ranges of seven to 10 days, there is usually so much uncertainty in the forecast that it’s better to look at broad weather patterns rather than what to expect at any one location”.

So, definitely, ‘the cat’s out of the bag’ about the accuracy of the predictability of climate and weather modelling. (I’ve covered the theory of the problem with modelling in another article.⁵)
