- DOCUMENTARY: “Altered Humans—How Biotech Is Changing Who We Are”
“In the documentary, “Altered Humans: How Biotech is Changing Who We Are”, Director Shaista Justin examines these claims with a slew of renowned technological industry experts. Delving deeper, she probes the moral and ethical questions surrounding these technologies, asking not only whether the science is plausible, but if it is even desirable. Does progress for the sake of progress really move the needle forward for us as a species, or are we merely unwitting victims of medical experimentation that shouldn’t be pursued in the first place?”

- “Science That Cannot Be Questioned Is Just Propaganda”
“I sit down with Rob Roos, a Dutch member of the European Parliament. Roos made global headlines after he got a Pfizer executive to publicly admit that Pfizer’s COVID-19 vaccine was never tested for stopping transmission of the virus. “At that moment, I realized this is a game changer,” says Roos. “We put it online and it was crazy. It went so far off, because everyone in the Western world—I can speak for them, I think—had the feeling they were fooled, really fooled by their governments. And that’s not what governments should do. They’re chosen to serve the people. But they fooled the people. It was a false narrative.” Roos says that media attempts to frame him as a purveyor of “misinformation” and the counter-argument that Pfizer had never claimed that the vaccine was tested on stopping transmission is mere gaslighting. “That was not my argument,” says Roos. “My argument was that our governments said that. But [Pfizer CEO] Mr. Bourla could have said to our governments, ‘Listen, we didn’t test it on that. You better not push people to these vaccines with that argument.’ He didn’t do that because there’s a lot of money involved, of course.”

- “Scientific Consensus—A Manufactured Construct”
“The appeal to “scientific consensus” is fraught with problems, just like “the science is settled,” “trust the science,” and other authoritarian tropes that have dominated the pandemic. A widely accepted theory, such as the theory of evolution, depends on a consensus being reached among the scientific community, but it must be achieved without censorship or reprisal. As Aaron Kheriaty, a fellow at the Ethics and Public Policy Center, recently said: “Science is an ongoing search for truth & such truth has little to do with consensus. Every major scientific advance involves challenges to a consensus. Those who defend scientific consensus rather than specific experimental findings are not defending science but partisanship.”

- “Science Betrayal” (Peter Ridd)
“There is no surer proof that people are losing faith in the scientific establishment than the recent Rasmussen poll of Americans which found 60 per cent of respondents agreeing that, ‘Climate change has become a religion that “actually has nothing to do with the climate” and is really about power and control’.” Even 45 per cent of Democrats agreed. This is a staggering result considering the relentless

barrage from almost every major science organisation on earth asserting that climate change is ‘real’ and dangerous. Despite all the indoctrination at universities, all the stories in the media by climate ‘experts’, a solid majority thinks they are being conned.”

- “1 in 36 Kids Have Autism, CDC Says”
“One in 36 (2.8%) 8-year-old children — 4% of boys and 1% of girls — have an autism spectrum disorder (ASD), based on an analysis of data from 2020, published today by the Centers for Disease Control and Prevention (CDC). The latest findings, reported in the CDC’s Morbidity and Mortality Weekly Report, show an increase from the last report, which found 1 in 44 8-year-olds (2.3%) had autism in 2018. Since the CDC started collecting the data, prevalence estimates have skyrocketed from 1 in 150 in 2000, to today’s estimate of 1 in 36 children.”

- “Commonly-Used Insecticides Could Raise Autism Risk: Study”
“Early exposure to a class of insecticides called pyrethroids could raise the risk of autism and other developmental disorders, even if the exposure is at levels deemed safe by federal regulators, new research has uncovered. Pyrethroids are one of the most widely used insecticides in the United States. They appear in both industrial preparations and consumer products. Several regions known for widespread pesticide use have documented higher rates of neurodevelopmental disorders (NDD). In the United States, as many as 17 percent of children are estimated to be affected by NDDs. The new study, published in the journal PNA Nexus on April 25, looked at the effects of low-level exposure to pyrethroids.”

- “Controversial mRNA Technology Now Targeting Livestock”
“According to a statement from the Queensland government in Australia, scientists are working to develop an mRNA-related vaccine to combat the threat of Lumpy Skin Disease (LSD) in beef cattle with \$1.15 million invested. “A new mRNA vaccine would be a game changer as the live virus vaccines currently available overseas cannot be used in Australia,” Mark Furner, minister for agricultural industry development and Fisheries and minister for rural communities, said in the statement. “Using existing vaccines here would result in us losing our disease-free status.””

- “Lab-Grown Meat: A Promising Future or Dystopian Fate?”
“Akin to the push to create various versions of plant-based meat, scientists have been propelled to develop lab-grown meat to provide an alternative to conventionally raised meat. To create meat, scientists combine animal cells from live animals with various nutrients like amino acids and carbohydrates. Then, under the right conditions, the cells replicate and produce “cultured meat”. While this process sounds as straightforward as whipping up your favorite cookie recipe, producing lab-grown meat requires cutting-edge technology and exceptional scientific precision.”
www.theepochtimes.com/health/lab-grown-meat-a-promising-future-or-dystopian-fate_5196077.html
- “Harmful Until Proven Otherwise : Artificial meat”
“What past harms might we have prevented by waiting for tests or studies, by having been less eager to take things at face value, and by thoroughly having assessed new and needed innovations for unforeseen consequences? My question is prompted by the news that GOOD Meat, the lab-grown or “cultured” meat division of Eat Just Inc., has received approval from the U.S. Food and Drug Administration (FDA) to start selling its first product—cultured chicken—to the American public. Very soon, for the first time in history, Americans will be able to eat chicken meat that hasn’t required the slaughter of a chicken to produce. All the nutrition, all the taste, without the cruelty of factory farming or the resulting dreaded carbon emissions. If you think this sounds too good to be true—you’d be right.”

- “Electric Vehicles Worse For Environment Than Petrol Cars Report”
“Japanese car giant Mitsubishi has published data that shows, based on current energy consumption and sourcing, electric cars are worse for the environment in Australia than petrol cars.”
www.drive.com.au/news/electric-vehicles-worse-for-environment-than-petrol-cars-report/
- “Does the Sun Cause or Prevent Cancer?”
“Over the past few decades, people have become increasingly aware of the risks associated with excessive exposure to ultraviolet (UV) radiation from sunlight, including skin cancer, photoaging, and cataracts. However, appropriate sun exposure provides benefits that are crucial for human health. Growing evidence suggests not only that sun exposure helps prevent and treat a variety of diseases but also that insufficient exposure to sunlight may increase the risk of cancer.”
