

MONTHLY UPDATES

SCIENCE (August 2023)

- **“Is the Goliath in Autism Research About to Fall?”**
“New study cements findings that autism has environmental rather than genetic causes. ...An extensive meta-analysis of 25 autism studies could shift the focus of research into the cause of autism from genetics to environmental triggers. That shift could open up new, revolutionary avenues for potential treatments. The research ties the disorder to changes in the gut microbiome, a community of microbes that live in the colon and are responsible for creating metabolites and other compounds crucial to our health and wellness.”

- **“Mosquitoes Modified to Spread Vaccines”**
“Genetically modified mosquitoes have been given the green light to be released in America. Programs for this started first in Florida in 2018, and then it was Texas. The programs are being expanded, and now there’s a push to release the GMO mosquitoes in other states.”

- **“Parasitic Ideas, the Warping of Science, and the Recipe for a Good Life”**
“I often joke that it takes intellectuals to come up with some of the dumbest ideas.” In this episode, we sit down with Gad Saad, professor of marketing at Concordia University and author of “The Parasitic Mind,” as well as, most recently, “The Saad Truth About Happiness.” What is the recipe to a good life? How do humor, grit, and gratitude factor into it? What are parasitic ideas, and how can we build resistance to them? And how has basic scientific inquiry been flipped on its head?”

- **“The aerosol transfer of antibodies between immune and non-immune hosts”**
“A new peer-reviewed study found that people vaccinated with the mRNA-based covid vaccines can transmit antibodies to unvaccinated individuals through aerosols. Meaning, they can transmit these antibodies through the air that we breathe. Furthermore, despite this being a new development (in a study that was only published recently) it appears that Pfizer knew about the possibility of this method of transmission being a thing. That’s because, in classified Pfizer documents (that were only released due to a Freedom of Information Act request) it turns out that all the way back in the year 2020, when they were still running their clinical trials, Pfizer made a special point to mention that women who are exposed to the vaccine through either inhalation or skin contact should be treated as having “exposed.””

REPORT: www.medrxiv.org/content/10.1101/2022.04.28.22274443v1.full.pdf
ABSTRACT: *“Despite the obvious knowledge that infectious particles can be shared through*

respiration, whether other constituents of the nasal/oral fluids can be passed between hosts has surprisingly never even been postulated, let alone investigated. The circumstances of the present pandemic facilitated a unique opportunity to fully examine this provocative idea. The data we show provides evidence for a new mechanism by which herd immunity may be manifested, the aerosol transfer of antibodies between immune and non-immune hosts.”
