- **“The sun’s poles are about to flip. The 11-year solar cycle, explained.”**
“Every 11 or so years, the sun undergoes an epic transformation: its magnetic poles reverse. Like on Earth, the sun has a magnetic North and a magnetic South. But unlike Earth, whose poles flip on the order of hundreds of thousands of years, the sun’s shuffle is a regular occurrence. The sun’s poles last reversed in 2013. So we’re just about due — likely starting some time this year. The solar poles flipping is not, as it might sound, the sign of impending apocalypse. You won’t notice it when it happens. The solar cycle only minorly impacts the climate here on Earth. But it’s what happens before the flip that can cause trouble.”

- **“A New Type of Autism Threatens American Children [from using device screens]”**
“Recent research published in JAMA Pediatrics identified a troubling association between early exposure to screens and various sensory processing problems in children. The study comes at a time when, rather alarmingly, one in three children under the age of 1 in the United States are swiping away on digital devices.”
